AQUASCREEN INSTALLATION

Aquascreen comes in 7’ x 100’ rolls and is made of PVC. It can be cut, sewn and snaps can be fixed to it. Grommets are included which can be used to tie weights or blocks to corners and edges and sink into place.

Another method which successfully allows for easy installation and repositioning, as well as yearly removal and cleaning if desired, is to cut and sew the screen into the required size and shape and to use lengths of rebar, folded into a hem, and then securing it with tie-wraps (suggested rebar length: 1 to 3 feet).

Aquascreen installation using sections of rebar and “tie-wraps”:

1. Use pre-cut rebars lengths. Roll the Aquascreen’s edge around the rebar placed at even places around the screen based on the surface to cover.

2. Use tie-wraps to secure the rebar in the hem of the screen.

3. Once the rebar lengths are all in place around the perimeter of the piece, it can be carried into position and lowered onto the pond or lake shore bottom (Rebars facing bottom of the pond).

The Aquascreen should be removed from the pond and cleaned at least once a year to keep its efficiency.
